# Disposition Øvelse 3

### Formål/intro:

- Opstil statiske og dynamiske krav -> anvend P-, PD- og PI regulator som løsning
- Opstilling:

# Princippet i fremgangsmetoden

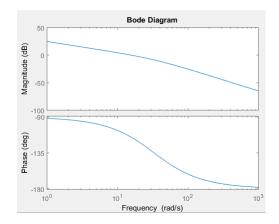

Tegn random bodeplot

Кp

- Krav = 5% OS -> fasemargin (
$$\phi_m = 65$$
) -> gg $\downarrow \uparrow$ 

Lead/PD 
$$G_{lead}(s) = \frac{1}{\beta} \frac{s + \frac{1}{T}}{s + \frac{1}{R \cdot T}} \cdot K_c$$

- Bestem 
$$\varphi_{m+}$$
 + ( evt. ekstra grader pga. lag, ca. 7°)   
-  $\beta=\frac{1-\sin(\varphi_{m+})}{1+\sin(\varphi_{m+})}$   $\omega_{\varphi m}=\omega_{max}=\frac{1}{T\sqrt{\beta}}$ 

$$G_{lag}(s) = \frac{s + \frac{1}{T}}{s + \frac{1}{\alpha T}}$$

- $\alpha$  -> dimensioneres efter steady-state-error specifikationen
- T -> 10 gg mindre end  $\omega_{\phi m}$

## Principperne anvendt i denne øvelse

- 1. 5% OS -> hæv Kp gain = 0 dB i  $\omega_{\varphi m}$  -> derefter med 30% OS
- 2. design Lead -> mindsk %OS
- 3. desgin lag -> mindsk steady state error
